Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Molecule type: protein

A. Residues: 9-14,23-29,30-53 GGNN

A. Residues: 9-14,23-29,30-53 GGNN

A. Residues: 9-14,23-29,30-53 GGNN

A. Residues: 9-14,23-29,30-53 GGNN

Ke all other intermediate filament proteins: a conserved alpha-helical region, whose hele all other intermediate filament proteins: a conserved alpha-helical region, whose hele conserved turns; domain bis acidic and rich in glutamic acid and lysine residues.

C. Comment: The anino-terminal headpiece is basic with at displaine residues.

C. Comment: The extra mass and high charge density that distinguish the neurofilament procharged scaffolding structure suitable for interaction with other neuronal components of C. Comment: This protein was isolated from spinal cord.

C. Superfamily: cytoskeletal keratin

F. 1-70/Domain: coil 1a, alpha-helical rod <RIA>

N.Alternate names: neurofilament light polypeptide (68K)
N.Contains: Glu-50 brain peptide
C.Species: Homo sapiens (man)
C.Species: Homo sapiens (man)
C.Date: 29-Jan-1993 #sequence revision 29-Jan-1993 #text_change 21-Jul-2000
C.Accession: S07144; I52832; Ā60703

Parent No. 6084085
GENERAL INFORMATION:
APPLICANT: Renato Baserga
APPLICANT: Mariana Resnicoff
APPLICANT: Consuelo D'Ambrosio
APPLICANT: Andre Ferber
TITLE OF INVENTION: Method of Inducing Resistance to Tumor Growth
                                                                                                                                                                                                                               ; Sequence 2. Application US/08625819; Patent No. 5958872; GENREAL INFORMATION:
APPLICANT: O'CONNOR, ROBEMALY; and APPLICANT: O'CONNOR, Renato L.
TITLE OF INVENTION: ACTIVE SURVIVAL DOMAINS OF IGF-IR TITLE OF INVENTION: AND METHODS OF USE
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSEE: HALE and DORR LLP STREET: 1455 Pennsylvania Avenue, N.W.

Diagnosing paraneoplastic syndrome e.g. paraneoplastic limbic encephalitis or neoplasm e.g. colon cancer comprising assessing sample for the presence or absence of antibodies to a Ma family polypeptide.

a test

Claim 48; Fig 6; 27pp; Japanese.

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parchid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or lung cancer. The present sequence is the Ma3 protein as given in the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence of human onconeuronal antigen Ma2. The invention discloses the detection and differential expression and regulation of the Ma2 gene in specific brain regions of AD patients. The Ma2 gene and its transcription and/or translation products may have a causative role in the regional selective neuronal degeneration typically observed in AD, or may confer a neuroprotective function to the remaining nerve cells. Methods are claimed for diagnostic function to the prognosticating a neurodegenerative disease, for monitoring the prognosticating a neurodegenerative disease, and for evaluating treatment of a neurodegenerative disease, and for evaluating treatment of a neurodegenerative disease, especially AD, in a subject by determining the level and/or activity of a transcription or translation product of an Ma onconeuronal antigen gene, especially Ma2. Also claimed the maximum of the treating or preventing AD and related neurodegenerative diseases are method for treating or preventing AD and related neurodegenerative diseases are using the Ma2 gene or its transcription or translation product; a method of screening for modulating agents of neurodegenerative diseases

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parotid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of esticular cancer, germ-cell tumour, and lung cancer. The present sequence is the Ma4 protein as given in the present invention
                                                                                                                                                                                                                                                                   ö.

                                                                                                            LRRAVEKRAIPRRIADQVRLEQVMAGATLNQMLWCRLRELKDQGPPPSFLELMKVIREEE 120
                                                                                                                               comprising novel human CDNA sequences and clones derived from human libraries. ABA9170 to ABA9376 represent human CDNA sequences from the present invention which encode the proteins given in ABB0562 to ABB05729. The human CDNA sequences and clones can be used in gene therapy. The clones may be used in a variety of applications, for example they may be used in profiling assays, for providing large arrays of human for implementing large-scale screening strategies and for treating diseases via gene therapy procedures

The present invention describes a method for diagnosing a paraneoplastic syndrome or neoplasm. The method comprises assessing a test sample for the presence or absence of antibodies to a Ma family polypeptide (I). The method is used to diagnose a paraneoplastic syndrome especially paraneoplastic limbic encephalitis and/or brainstem encephalitis or neoplasm in an individual. The method diagnoses the neoplasm by assessing antibodies to (I) preferably Mal, which is indicative presence of breast cancer, colon cancer, parottid gland cancer, lung cancer, testicular cancer and germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or Ma2, which is indicative of testicular cancer, germ-cell tumours or Ing cancer. The present sequence is the Ma5 protein as given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ξ,

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX aequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparthisonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthitic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodespenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypothematosus, severe combined immunodeficiency

Isolated polypeptide with a human membrane associated protein sequence is useful for the diagnosis, prevention and treatment of cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAF81741 to AAF81777 encode the human membrane associated proteins (MEMAP) given in AAB74695 to AAB74731. MEMAPS have cytostatic, antinfinglammatory, anticonvulsant, immunosuppressive, antidiarrheic and antiarteriosclerotic activities, which can be used in gene therapy. MEMAPs and agonist of MEMAPs can be used to treat a disease or condition associated with decreased expression of functional MEMAP and antagonists of MEMAP are used to treat a disease or condition
(SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to

proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders. The MEMAP polynucleotides and proteins are also used for the diagnosis of these disorders. Specific examples of these disorders inclammation, atherosclerosis, epilepsy and diarrhoea bind MEMAP proteins can be used to screen for compounds which specifically bind MEMAP including antibodies, oligonucleotides, proteins and small molecules. MEMAP polynucleotides can be used to prepare transgenic animals which can be studied to provide information concerning human disease. Anti-MEMAP antibodies are useful in immunoassays for the detection of MEMAP protein and can be used as attagonists to treat or prevent a disorder associated with MEMAP. Polynucleotides encoding MEMAP can be delivered to target cells with genetic abnormalities with respect to the expression of MEMAP to treat or prevent a disorder associated with negated to the expression of MEMAP to treat or prevent a disorder associated with

The invention comprises the amino acid and coding sequences of seven thman proteins that are preferentially expressed in adult whole brain, foetal whole brain, tonsil and adult hippocampus tissue. The DNA sequences are useful for the analysis of disease-associated single nucleotide polymorphisms and the production of knockout and human disease the prevention (vacchie) and treatment of cancer and neurological the prevention (vacchie) and treatment of cancer and neurological discretes. The present amino acid sequence represents a human protein of
                                                                                                                                                                                                                                      2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, forensics, see mapping, medical imaging, identification of mutations responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or ameliocating medical conditions, such as cancer, neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                             periodontal disease, liver fibrosis, infections (e.g. viral, fungal or bacterial) or autoimmune diseases (e.g. diabetes, atopic dermatitis). Sequences ABG9988-ABG9988 and ABU00010-ABU00433 represent human polypeptides of the invention. Note: The sequence data for this patent not represented in the printed specification but is based on sequence information supplied by the European Patent Office

01-NOV-2000; 2000WO-US030040. 05-NOV-1999; 99US-01635B0P. (HUMA-) HUMAN GENOME SCI INC.

The secretary proteins and vient genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

Pathological conditions can be diagnosed by determining the amount of the conventions in the mew genes. Specific uses are described for each of the 24 genes, the new genes. Specific uses are described for each of the 24 genes, cared the insues in which they are most highly expressed, and include disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune of seases (e.g., rheumantoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., Alzheimer's disorders, and infections. The psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiopenic disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell consideration, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting constant ligands or binding to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., the the disorders mentioned above, and in diagnostic immunoassays e.g., and the disorders mentioned above, and in diagnostic immunoassays or green transplantation. secreted proteins and their genes are useful for preventing, treating

AMEDIAL AMBOILED AMEDIAL REPRESENT CHANAS CORRESPONDING TO & A numan secreted protein genes, and AAEDIALA-AAEDIAL represent the proteins they encode. AAEDIALA-AAEDIALO represent human secreted protein variants or fragments. The secreted protein variants or fragments. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 24 genes, the new protein products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, foetal and developmental abnormalities, haematopoietic disorders, foetal and developmental abnormalities, cancer, tumours, foetal and developmental abnormalities, neurological disorders (e.g., Alzheimer's disease, parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., pregnancy-related disorders, and encouraged pastrointestinal disorders, and orders, and orders, and cale wound healing and epithelial cell profileration, to prevent skin aging due to sunburn, to maintain organs to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or profession of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay or enzyme linked immunosorbent assay (ELISA). The content referred to the invention men be used and interpedict interpediction the breadted provent of the invention and be used and interpedictic immunoassay or enzyme linked immunosorbent assay (ELISA). The content of the invention and bove, and in the disorders mentioned above, and in the disorders mentioned the protein fragment treferred to the propertice.
                                                                                                                                                                                                                                                        New isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 DLMHIVQADNPSISVEECLEAFKQVFGSLESRRTAQVRYLKPYQEEGEKVSAYVLRLETL

AMENIAP) given in AAD74695 to AAB7711. MEMARPS have cytostatic, antiinfiammatory, anticonvulsant, immunosuppressive, antidiarrheic and antiinfiammatory, anticonvulsant, immunosuppressive, antidiarrheic and antiarrheic antiarrheic activities, which can be used in gene therapy.

CMPARPS and agonist of MEMARPS can be used to treat a disease or condition associated with decreased expression of functional MEMAP and antagonists of MEMAP are used to treat a disease or condition associated with decreased expression of functional MEMAP. These disorders include cell coverexpression of functional MEMAP. These disorders include cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders. The MEMAP polynucleotides and proteins are also used for the disorders of these disorders. Specific examples of these disorders include cancer, inflammation, atherosclerosis, epilepsy and diarrhoea. MEMAP proteins can be used to screen for compounds which specifically bind mEMAP polynucleotides can be used to prepare transgenic animals which can be studied to provide information concerning human disease. Anti-MEMAP antibodies are useful in immunoassays for the detection of MEMAP proteins and can be used as antagonists to threat or prevent a disorder associated with MEMAP. Polynucleotides encoding MEMAP can be etset cells with genetic abnormalities with respect to the expression of MEMAP to treat or prevent a disorder associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polypeptide with a human membrane associated protein sequence is useful for the diagnosis, prevention and treatment of cell proliferative, autoimmune/inflammatory, neurological and gastrointestinal disorders.

The invention relates to isolated NOVX (NOVX1-11) polypeptides and the polymucleotides that encode them. NOVX polypeptides, polymucleotides and anti-NOVX antibodies are useful for treating or preventing a pathology associated with NOVX polypeptide in humans and for treating a syndrome cassociated with human disease e.g. disorders characterised by altered cassociated with human disease e.g. disorders characterised by altered cassociated with NOVY polypeptide in humans and for treating a syndrome cassociated with human disease e.g. disorders, angiogenesis and wound healing (NOV1-3), neurological disorders, e.g. episodic ataxia, caucosomal dominant myokymia stroke, Parkinson's disease, Alzheimer's disease, non-insulin dependent diabetes mellitus, asthma, hypertension and seizure (NOV4), enamel defects, including hypoplasia and disorders involving enamel defects, including hypoplasia and disorders involving enamel defects, including hypoplasia and casorders involving enamel defects, including hypoplasia and disorders, parameoplastic limbic of brain-stem encephalitis occurring during parameter, diabetes, reproductive health, metabolic and endocrine disorders, gastrointestinal disorders, immune disorders and autoimmune disorders, leukaemia/lymphoma and tissue/cell growth regulation disorders (NOVB), lesional psoriatic skin (NOVB-10) and atheroscalerosis, abdominal cance also useful for identifying a nagent that binds to it and a cell expressing NOVX polypeptide is useful for identifying a therapeutic agent
                                                                                                                                                                  Human; NOVB; cytostatic; nootropic; neuroprotective; vulnerary; cerebroprotective; antiparkinsonian; hypotensive; antiasthmatic; antidiabetic; antipartinflammatcry; immunosuppressive; antiatherosclerotic; dermatological; cancer; neurological disorder; parkinson's disease; diabetes mellitus; asthma; enamel defect; immune disorder; actoimmune disease; respiratory disorder; bone disorder; neurological disorder; attoimmune disease; respiratory disorder; one disorder; eell growth regulation disorder; lestonal psoriatic skin; attherosclerosis; abdominal aortic aneurysm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polypeptides and nucleic acids homologous to members of collagen, potassium channel, tuftelin family of proteins for diagnosing, treating cancer, atherosclerosis, neurological, skin and enamel defect disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Shimkets RA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Fernandes E,

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 16040; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length CDMAs defined in the specification. Where a primer set comprises:
(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a

```
polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18642 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAB95891 oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                ω
